

SETTING UP OBS - BASICS

Shows live in your stream what's currently running in the frontend - cover art, title, RA progress and more. Three building blocks, each optional on its own.

PREREQUISITES

- ✓ MiSTer and streaming PC on the same network (WiFi/LAN)
- ✓ MiSTer's IP address known (visible in the MiSTer main menu under Network, for example)
- ✓ OBS Studio installed

1

Enable the stream overlay

In the frontend: System -> Display & Sound -> "Stream overlay: OFF -> turn on". Then restart the frontend once - takes effect only after that.

2

Add a browser source in OBS

In OBS: Add Source -> "Browser". Set width/height to your stream canvas (e.g. 1920x1080) - the rest stays transparent.

Address for the browser source:

`http://192.168.1.50:8080/`

Full details, troubleshooting and every other frontend feature: README.md in the project repository.

SCREEN MIRROR & APPEARANCE

Two more building blocks, usable independently of each other - both require step 1 (stream overlay active).

3

Enable the screen mirror (for CRT users)

Handy if you run on CRT and can't see HDMI directly. In the frontend: System -> Display & Sound -> turn on "Screen mirror", restart the frontend. Shows ONLY the frontend screen, not the running game - that needs a capture card (see page 3).

Additional browser source (optional):

```
http://192.168.1.50:8080/mirror
```

4

Customize the appearance

Colors, position, which info is shown - you do NOT set this on the screen with the controller, but on a webpage in your browser (PC or phone, as long as it's on the same network as the MiSTer). Takes effect immediately, no frontend restart.

Open this address in your browser:

```
http://192.168.1.50:8080/admin
```

Full details, troubleshooting and every other frontend feature: README.md in the project repository.

AUTOMATIC SCENE SWITCHING

Advanced, completely optional: OBS automatically switches to the game scene on launch and back to the menu scene on exit - the frontend detects both on its own.

ADDITIONAL PREREQUISITES

- ✓ Capture card on the MiSTer's HDMI output (gets the live game feed there, independent of the CRT signal)
- ✓ Two OBS scenes already created (any names, e.g. "Frontend" and "Live Game")
- ✓ OBS' WebSocket server enabled

5

Enable OBS' WebSocket server

In OBS: Tools -> WebSocket Server Settings -> "Enable WebSocket server". Note the port and password there (regenerate the password if needed).

6

Enter it on the same browser page

The same webpage as in step 4 (so NOT the frontend menu on screen, but the browser) - scroll down there to the "Automatic scene switching" section: enter the OBS machine's IP address, port and password from step 5, both scene names exactly as in OBS, turn on "Enabled". Takes effect immediately, no restart needed.

Runs completely fault-tolerant: if OBS is unreachable or misconfigured, the scene switch is simply skipped - game launch and return to the menu are never affected by it.

Full details, troubleshooting and every other frontend feature: README.md in the project repository.
